* _Photoshop Elements_ is a more affordable version of Photoshop and is designed for beginners and professionals alike. * _Adobe Lightroom_ is a program that can be used in conjunction with Photoshop to develop, edit, organize, and optimize images. ## Understanding Why You Need to Use Image Editing For some photographers, starting with the basic steps required for developing an image can lead to a pretty sophisticated body of work. The more you use Photoshop and other image editing tools, the more you will find that what you see in Photoshop was in your eye to start with. In fact, some images that you might edit in Photoshop could have existed in your mind to begin with, or even in your camera's memory card. However, when you take an image from your camera, whether you shoot it on film or using the modern digital formats (with or without a digital camera back), the first thing you should do is check the raw data to verify your image. After all, you don't want to waste time and photographic prints on a print that was taken out of focus, or with an exposure that is too low, thereby blurring the image. As I mentioned earlier, digital photography makes the preservation of raw file data much easier. You should, however, verify this raw data in order to make sure that the camera has been set up correctly and that it's capturing the image properly. You should also do this even if you intend to enhance the raw data later. Before using a Photoshop tutorial to create a complicated print with extremely careful techniques, have your image displayed on your monitor so that you can see what you're doing. You can also preview what the final print will look like as you edit your print. As you enhance your image, you need to edit the exposure, white balance, and color in order to create a sharp, vibrant image. In the process, you may discover other issues that you didn't see in your initial raw data, such as an out-of-focus image, poor clarity, or a color shift. So why do you need to edit your image? Well, as with most things in life, there are pros and cons to using a tool like Photoshop. For example, the initial print size and quality may not be sufficient for a display that you want to show off, or to create a photo book. However, the ability to manipulate an image is essential to

creating sophisticated prints that reproduce the color tones and exact feel of a particular

Q: How can I use Javascript to check if a string is a valid url? Basically, I want to check if a string is a valid url, and make a link element if it is. I'd like to know if there's a quick way of doing this (so I can avoid having to use a bunch of regex). Also, in my particular case, I'd like to make sure it's a file path, not a directory path, in which case the directory separator will be replaced with a ".". I know you can use this to test a string is a valid name: validateName("hello world"); But what if I wanted to do the same, except for a url? A: You may use function validateURI(s) { var re = /^(?:(?:https?|ftp)://)?(?:[^'\s/]*(?:[^:'\s/]*))[^'\s/]*)*(?:\.[^'\s/]*(?:[^:'\s/]*))?$/i; return re.test(s); } Note that ^ and $ are used to prevent a search of the entire string, while the * allows the string to contain even a single space. Moreover, the lookbehinds i), ii), iii) in the regular expression were introduced to allow finding either ftp:// or or in the beginning or right after a non-space character. Here is the demonstration of how it works: var s = "ftp://ftp.zip.se/index.html"; //- so it starts with ftp:// var re = /^(?:(?:https?|ftp)://)?(?:[^'\s/]*(?:[^:'\s/]*))[^'\s/]*)*(?:\.[^'\s/]*(?:[^:'\s/]*))?$/i; //- the regular expression starts with `^` and ends with `$`; //- `.*` means any sequence of non-newline characters, and the `i` flag is used to make //- the case-insensitive comparison console.log(
